

# Measuring the Subjective User eXperience

By Drs. M.C. Kaptein PdEng.

Eindhoven University of Technology / Philips Research / Stanford University  
maurits.kaptein@philips.com

These handouts are subject to change prior to the tutorial. Please contact M.C. Kaptein for the latest version.

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

Where innovation starts

## About the presenter

- **Drs. Maurits Kaptein PdEng:**
  - BSc. Psychology (University of Tilburg – NL)
  - Msc. Economic psychology (University of Tilburg – NL)
- **Professional doctorate in Engineering: User System Interaction (Eindhoven University of Technology)**
- **Researcher @ Vodafone Research**
- **Research Development Manager @ De Vos & Jansen Marketing research**
- **Research Scientist @ Philips Research**
- **PhD candidate Eindhoven University of Technology / Stanford University**

## Aim of the tutorial

1. **Get acquainted with the psychology terminology of designing and validating questionnaires**
2. **Have a thorough overview of the process of designing a questionnaire**
3. **Understand reliability and validity**
4. **Learn how to phrase items and design questionnaires**
5. **Learn about different sampling methods**
6. **Get acquainted with statistical techniques to validate questionnaires**

## Overview of this tutorial

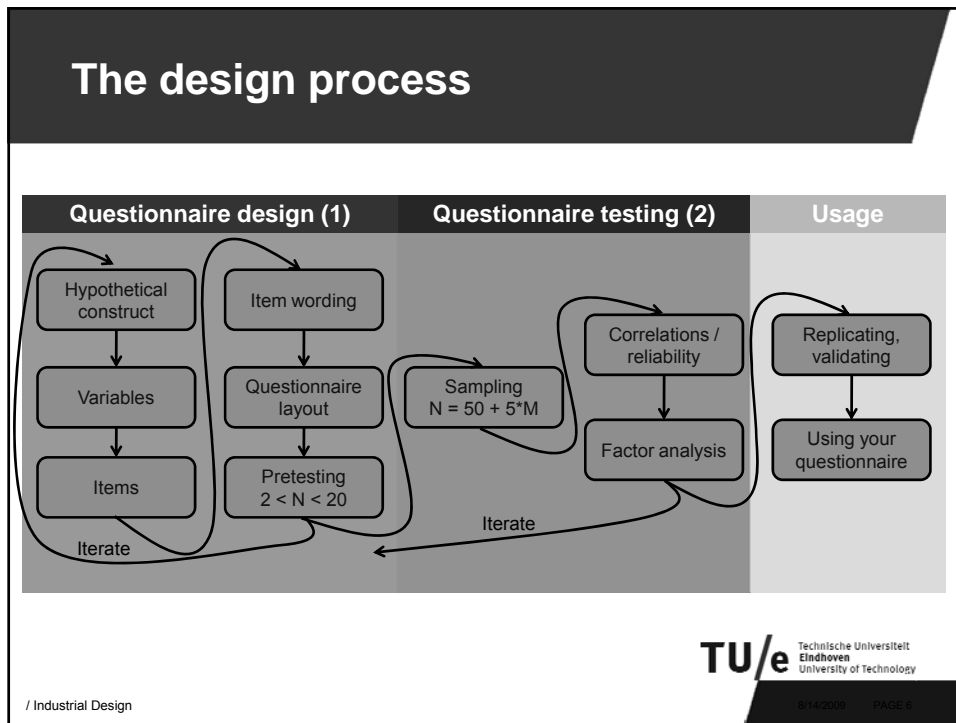

1. **The full design process**
2. **Questionnaire design**
  1. **Item construction**
  2. **Question wording**
  3. **Survey construction**
  4. **Pretesting**
3. **Theory of reliability and validity**
4. **Sampling**
5. **Statistical validation**
  1. **Correlations**
  2. **Cronbach's Alpha**
  3. **Factor analysis**

## Hypothesis driven research

1. Think through your *research questions* and objectives before you write questions
2. Prepare an *analysis plan* before you write questions
3. Ask yourself, in relation to points #1 and #2 above, if each question on your list is necessary? Even if the data would be 'interesting' it has to ultimately be used in analysis to make the cut!

## Theoretical background

Core concepts of questionnaire design

## Hypothetical construct

Definition	Practical HCI examples
<p style="text-align: center;"><i>A hypothetical construct is an identifier for a collection of attitudes or behaviors relating to underlying features or causes</i></p>	<ol style="list-style-type: none"> <li>1. Usability</li> <li>2. Social connectedness</li> <li>3. Social presence</li> <li>4. Fun</li> <li>5. Engagement</li> <li>6. System intelligence</li> <li>7. Social intelligence</li> <li>8. User intelligence (IQ)</li> </ol>

**TU/e** Technische Universiteit Eindhoven  
 University of Technology

/ Industrial Design 8/14/2009 PAGE 7

## Identifying (latent) variables

### Definition

*A latent variable is one of the attitudes or behaviors which together form a hypothetical construct.*

### IQ examples

1. Language skill
2. Shape recognition
3. Logic
4. Mathematical ability
5. Creativity

## Operationalizing items

### Definition

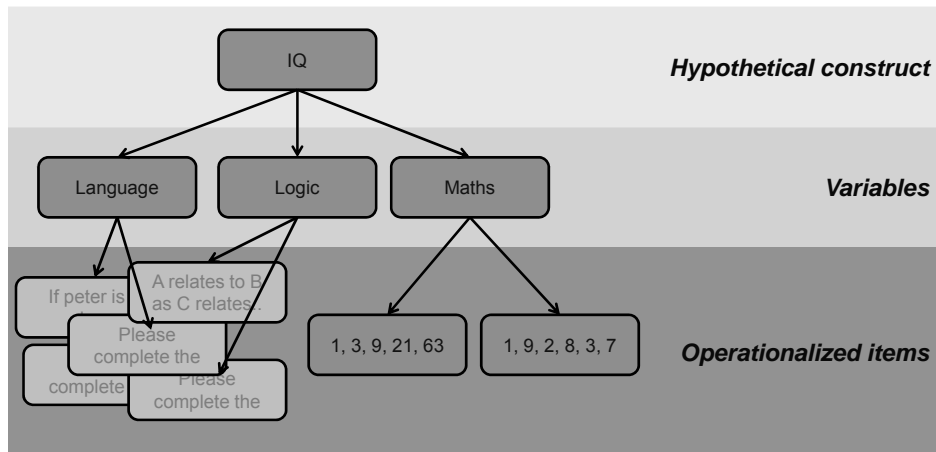

*Operationalizing items relates to the translation of variables into items presented to the user.*

### Mathematical ability

1. 1,3,9,21,63,  $X_a$
2. 1,9,2,8,3,7,  $X_b$
3. 112, 2112, 122112, 11222112,  $X_c$

$$X_a = 198; X_b = 4; X_c = 21322112$$

## Overview

## Generating an item pool

1. Determine the constructs you want to measure.
2. Find its variables
  1. In literature
  2. Trough qualitative sessions (focus groups)
3. Generate items
  1. From literature
  2. From qualitative session (brainstorms)

# Designing your own

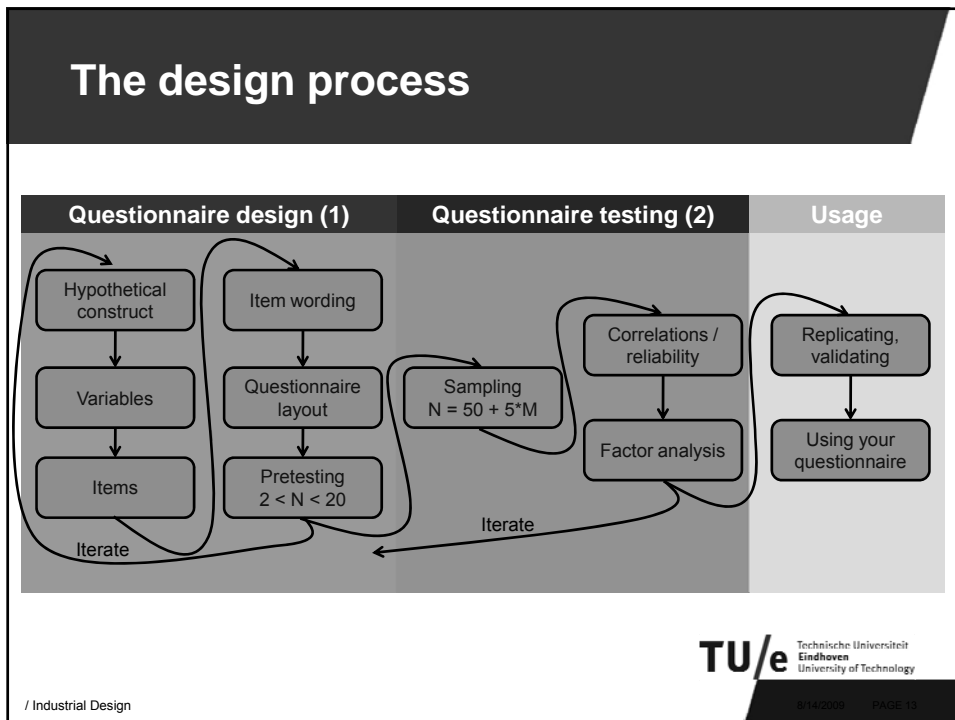

From constructing items to pretesting

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

Where innovation starts

/ Industrial Design SPWSE02

## Main steps after generating your item pool

1. Write the introduction to your questionnaire
2. Evaluate the content of each item
3. Evaluate inability or unwillingness to answer
4. Critically assess question wording
5. Determine the order of questions
6. Determine form and layout
7. Determine method of administering
8. Pretest your questionnaire
9. Iterate

## Create the introduction

1. Fully inform participants about the research
  1. Who conducts the research?
  2. Why is it conducted?
  3. What is the aim?
  4. What is the length?
  5. What will the data be used for?
2. Obtain informed consent
3. Understand your target population
  1. Adapt your language
4. Put screening questions up front
  1. Use dummy questions when the topic is sensitive

## Introduction example

The screenshot shows a form titled 'Introduction example' with the following text and annotations:

**Welcome to this study!** (Annotation: Topic of the study)

Thanks for participating in this study on **human decision making**.

During this study you will be asked to answer several questions involving decision making.

You will perform some of these tasks together with others. Please wait for a sign from the experimenter before you start this study. We will couple you with another participant based on your gender and age. We will also display your feedback to your partner.

For every question it will be clear whether or not your partner can see your answer.

You will be guided through the study step by step. If anything is unclear do not hesitate to ask the experimenter.

The study consists of two parts. For each part you will be rewarded with one other participant to purchase the tasks.

We do not expect any harm resulting from this experiment. By participating in this experiment you will get a better insight in how social economic experiments are setup and carried out. However, we cannot and do not guarantee or promise that you will receive any benefits from this study. You will not receive payment for your participation.

Please try to answer all the questions honestly. There are no right or wrong answers. Do not go back to previous pages. Prompt this study in the order it is presented to you. If you experience any problems, please notify the experimenter. This study takes no more than 15 minutes.

If you have read this form and have decided to participate in this project, please understand your participation is voluntary and you have the right to withdraw your consent or discontinue participation at any time without penalty or loss of benefits to which you are otherwise entitled. The information is not to participate. You have the right to withdraw your consent at any time. Your individual privacy will be maintained in all published and written data resulting from this study.

This research is conducted by:  
Dr. Martinus van der Vlist  
m.van.der.vlist@tue.nl

Please feel free to contact us at any time with questions regarding this study, including concerns and complaints. If you feel that by participating in this study you are being misled, please contact:

Please fill out the following question and click 'next' to start this study:

I understand the information presented above and agree to participate in this study.  
 Yes  
 No

Next

Labels on the right side of the form:

- Topic of the study
- Process
- Length
- Data usage
- Consent
- Contact

TU/e Technische Universiteit Eindhoven University of Technology

/ Industrial Design

8/14/2009 PAGE 16

## Evaluate the context of each question

1. For each question, determine if the question is necessary
2. Do not use double barreled question
3. Use familiar wording and spelling – adapt to the target group
4. Can the respondent remember?
5. Can the respondent articulate?

## Identify unwillingness or inability to answer

1. **Minimize the effort required of participants**
2. **Is the context of the questions clear and appropriate**
3. **Make a request for information seem legitimate**
4. **In case of sensitive information:**
  1. **Place items at the end**
  2. **Preface with a 'common' statement**
  3. **Ask questions in 3rd person**
  4. **Hide questions in between others**
  5. **Provide response categories**
  6. **Use randomized techniques**

## Question wording

1. **Define the issue in Who, What, When, Where, and what way (how)**
2. **Use ordinary words**
3. **Avoid ambiguous words**
4. **Avoid leading questions**
5. **Avoid implicit alternatives that are not expressed in the options**
  1. **Exclusive and exhaustive categories**
6. **Avoid implicit assumptions**
7. **Don't make respondents compute**
8. **Use both positive as well as negative statements**

## Bad examples 1: Double barreled questions

**Bad**

*Did you enjoy using our application,  
and would you buy it?*

**Better**

*Did you enjoy using our application?  
Would you buy this application?*

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

/ Industrial Design

8/14/2009 PAGE 20

## Bad examples 2: Leading questions

**Bad**

*Smart people generally do not watch  
a lot of television. Do you watch a lot  
of television?*

**Better**

*Do you watch television?  
How many hours a week do you  
spend watching television?*

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

/ Industrial Design

8/14/2009 PAGE 21

## Bad examples 3: People are bad at estimating

### Bad

*Please specify how many minutes you spend each month using the internet: \_\_\_ Min.*

### Better

*How many hours a week, on average, do you use the following:*

- Email
- Instant messaging
- And so on...

## Bad examples 4: History

### Bad

*What color socks were you wearing last Tuesday?*

### Better

*Are you currently wearing socks?*

*What color socks are you wearing today? (At least people can have a look)*

## Bad examples 5: Jargon

Bad		Better												
<p><i>Using the system made me feel more socially connected to my social network:</i></p> <p>Agree _____ Disagree</p>		<p><i>I felt closer to my friends by using the system:</i></p> <table border="1"> <thead> <tr> <th>Disagree</th> <th></th> <th></th> <th></th> <th>Agree</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> </tbody> </table>			Disagree				Agree	0	0	0	0	0
Disagree				Agree										
0	0	0	0	0

Eindhoven  
University of Technology

8/14/2009 PAGE 24

## Question order

1. **Make the opening questions simple**
2. **Qualifying questions should be in the beginning**
3. **End with identification questions**
4. **Put difficult questions at the end**
5. **From general to specific**
6. **From recent to old**
7. **Group items by topic**
8. **Make branching transparent**

# Layout

## Confusion over Palm Beach County ballot

**Although the Democrats are listed second in the column on the left, they are the third hole on the ballot.**

**Punching the second hole casts a vote for the Reform Party.**

(REPUBLICAN)	2	(REFORM)	4
GEORGE W. BUSH, PRESIDENT		PAT BUCHANAN, PRESIDENT	
DICK CHENEY, VICE PRESIDENT		ELENA FOSTER, VICE PRESIDENT	
(DEMOCRATIC)	5	(SOCIALIST)	6
AL GORE, PRESIDENT		DAVID McREYNOLDS, PRESIDENT	
JOE LIEBERMAN, VICE PRESIDENT		SABRY CALI HELLIS, VICE PRESIDENT	
(LIBERTARIAN)	7	(CONSTITUTION)	8
HARRY BROWNE, PRESIDENT		BOWARD PHILLIPS, PRESIDENT	
ART OLEWIK, VICE PRESIDENT		J. CURTIS FRAZIER, VICE PRESIDENT	
(GREEN)	9	(WORKERS WORLD)	10
RALPH NADER, PRESIDENT		MONICA MOOREHEAD, PRESIDENT	
WYNONA LAZONKE, VICE PRESIDENT		GLORIA LA RIVA, VICE PRESIDENT	
(SOCIALIST WORKERS)	11		
JAMES HARRIS, PRESIDENT			
MARGARET TROVIE, VICE PRESIDENT			
(NATURAL LAW)	12		
JOHN HADELIN, PRESIDENT			
NAT GOLDHABER, VICE PRESIDENT			

**WRITE IN CANDIDATE**  
To vote for a write in candidate, follow the directions on the long stick of your ballot card.

Sam Zentgraf/graphics/Daniel Heiblock

# Layout checklist

- Number all questions
- Use large clear type, don't crowd
- Make use of white space
- Make answer categories clear
- Consistent placement
- Small to large
- Group related topics
- Don't split questions across pages
- Distinguish directions from questions

## Layout checklist

1. Number all questions
2. Use large clear type, don't crowd
3. Make use of white space
4. Make answer categories clear
  1. Consistent placement
  2. Small to large
5. Group related topics
6. Don't split questions across pages
7. Distinguish directions from questions

## Answer categories

What is your overall satisfaction with our product?

Not at all satisfied      Extremely satisfied

What is your overall satisfaction with our product?

Not at all satisfied 1 2 3 4 5 Extremely satisfied

What is your overall satisfaction with our product?

1  2  3  4  5

What is your overall satisfaction with our product?

Not at all Slightly Moderately Very Extremely  
satisfied satisfied satisfied satisfied satisfied

### • For likert type scales:

- Even or odd?
- Labeling?
- Number of options?
- "Don't know"?
- Pictorials?

## Methods of administering questionnaires

- Paper and pencil
- Personal interviews
- CAPI
- CATI
- CAWI
- Mobile phones

## Pretesting your questionnaire

- Always pretest!
- Test all aspects of the questionnaire
- Test with the target group
- Test in the target medium
- Talk to your participants
- Re-test after modifications: Iterate
- Do not use the data from your pretest.

## A nice questionnaire?

**QUESTIONNAIRE AT RECYCLING POINT**

Location .....

Excuse me, I am a college student carrying out an investigation into recycling in this borough as part of my A Level geography course. Could you help me by answering a few questions please?

- How often do you use this facility?
  - More than once a week
  - Once a week
  - Once a fortnight
  - Other (please state)
- Do you use this recycling point because
  - It is close to home and an easy way to dispose of rubbish?
  - It is easy to use when going to shop/work?
  - Or do you have to make a special journey to use this facility?
  - Other (please state)
- How far do you travel to this site?
  - under 1/2 mile
  - 1/2 to 1 mile
  - 1-2 miles
  - over 2 miles
- How did you travel to the site?
  - Walk
  - Car
  - Cycle
  - Other
- Do you find any of the following problems at this site?
  - Noise and fumes from traffic coming on to the site
  - Noise and fumes from lorries taking away the materials
  - Litter
  - Vandalism
  - Smell
  - pests (e.g. flies)
- Do you think that the value of recycling outweighs any environmental problems that you have identified in the previous

What to do with this?

Minimal intro

Logical categories?

No white space

Inconsistent placement

/ Indu

## Reliability and Validity

Evaluating a questionnaire

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

Industrial Design

Where innovation starts

SPINR03

## Reliability

- **The degree to which measurements are consistent and do not contain errors**
- **Score of a participant = Score of the overall mean + effects of belonging to a group + error**
- **Reliable: Measuring kilograms using a calibrated scale**
- **Unreliable: Measuring length using a flexible cord**

## Common error: Regression towards the mean.

- **We perform an experiment to test our new interactive math education system:**
  - We select the worst 20% of the a classroom – Their average math score is 3.2 out of 10.
  - We have them use our system for 1 week.
  - The average math score is now 4.5 out of 10.
- **We perform an experiment to test our new dice throwing training program.**
  - We select people that throw a 1 or a 2. Their mean dice score is 1.5.
  - We have them train for a week
  - The average dice throwing score is now 3.5

## Validity

- The extend to which a procedure measures what it intends to measure
- Does the IQ test really measure “*intelligence*”
- Valid: Measuring kilograms using a calibrated scale.
- Invalid: Measuring kilograms using a ruler.

## Construct and content validity

### Construct validity:

*Do our variables properly represent the hypothetical construct?*

Is IQ really a combination of Math, Logic, and Language?

### Content validity:

*Do our items really measure the intended variable?*

Is 1,3,9,21,63, .. A good reflection of mathematical ability?

## Other types of validity

- **Internal validity: Does the experimental setup indeed manipulate what is intended?**
  - No confounds?
  - No alternative interpretations?
- **External validity: Can the findings be generalized?**
  - Ecological validity
  - Temporal validity
- **Face validity?**

## Research methods and validity

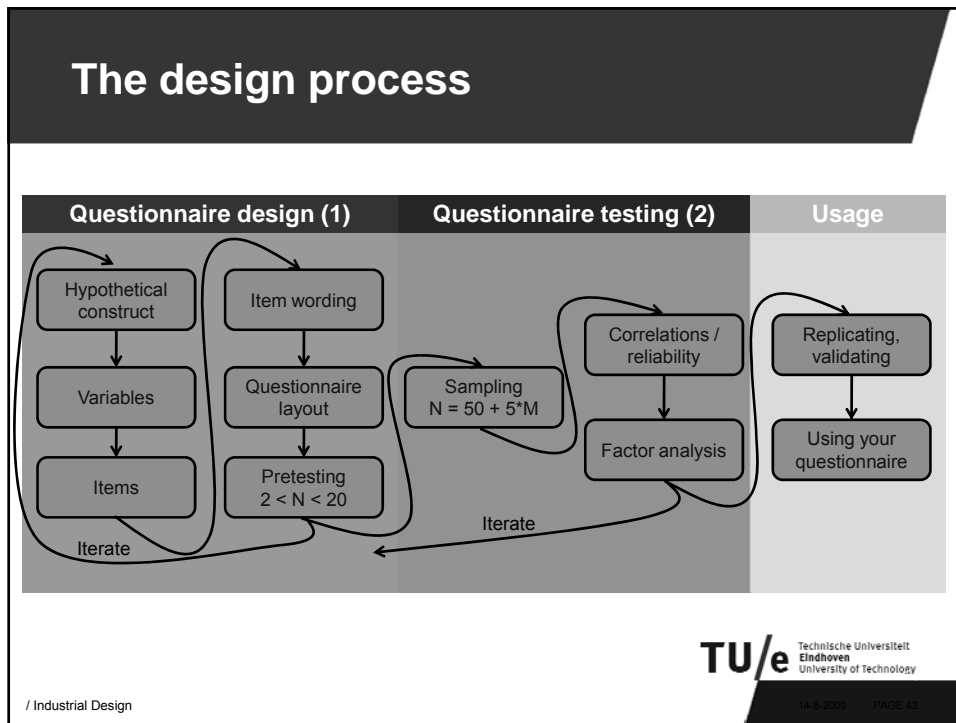

- |   |   |
|---|---|
| <ul style="list-style-type: none"> <li>• <b>Experiments</b> <ul style="list-style-type: none"> <li>- Great control over confounding variables</li> <li>- Out of context</li> </ul> </li> <li>• <b>High internal validity</b></li> <li>• <b>Low external validity</b></li> </ul> | <ul style="list-style-type: none"> <li>• <b>Correlational studies</b> <ul style="list-style-type: none"> <li>- Limited control over confounding variables</li> <li>- In context</li> </ul> </li> <li>• <b>Low internal validity</b></li> <li>• <b>High external validity</b></li> </ul> |
|---|---|

## Recapp

- **We have covered:**
  - From construct to item
  - Item generation
  - Questionnaire generation
  - Pretesting
  - Theoretical evaluation based on reliability and validity

## Measuring the Subjective User eXperience – part 2

A quantitative approach.

## Sampling respondents

So, who should fill out your questionnaire

**TU/e** Technische Universiteit Eindhoven  
 University of Technology

Industrial Design Where innovation starts PAGE 49

## Designing your sample

- Define the population
- Determine the sampling frame
- Select a sampling technique
- Determine sample size
- Get those people

## Sample size

- **Sample size considerations:**
  - Pretest  $2 < N < 20$
  - **Quantitative evaluation:**
    - $N > 300$
    - $N = 50 + 5 \cdot m$
    - Rules of thumb

## Different sampling techniques

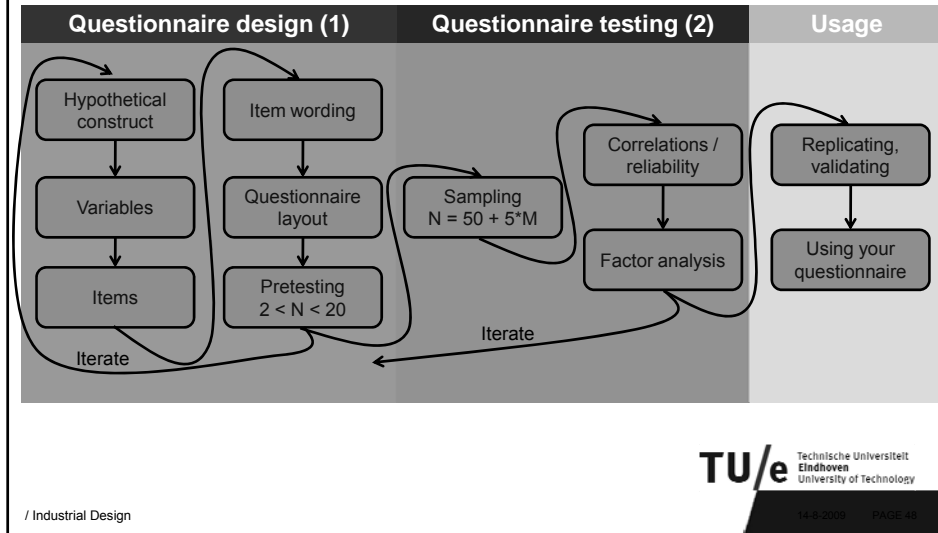

- **Non probability sampling**
  - Convenience sampling
  - Judgemental Sampling
  - Quota Sampling
  - Snowball Sampling
- **Probability sampling**
  - Simple Random Sampling
  - Systematic Sampling
  - Stratified Sampling
  - Cluster Sampling

## Statistical analysis

We now have a lot of numbers – so what do we do with those

## The design process

/ Industrial Design

TU/e Technische Universiteit  
Eindhoven  
University of Technology

14-8-2009 PAGE 48

## Correlation – Pearson product moment

- The statistic is defined as the sum of the products of the standard scores of the two measures divided by the degrees of freedom. Based on a sample of paired data  $(X_i, Y_i)$ , the sample Pearson correlation coefficient can be calculated as:

$$r = \frac{1}{n-1} \sum_{i=1}^n \left( \frac{X_i - \bar{X}}{s_X} \right) \left( \frac{Y_i - \bar{Y}}{s_Y} \right)$$

$$r = \frac{\sum_{i=1}^n (X_i - \bar{X})(Y_i - \bar{Y})}{\sqrt{\sum_{i=1}^n (X_i - \bar{X})^2} \sqrt{\sum_{i=1}^n (Y_i - \bar{Y})^2}}$$

TU/e Technische Universiteit

5	1	-1	1	0	x

## Scatter plots

# Correlations in SPSS

# Correlations are linear

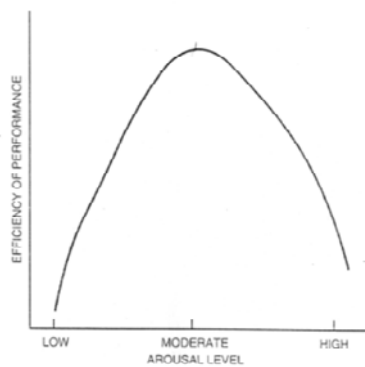

Figure 4-5 Hypothesized relationship between performance efficiency and level of arousal, illustrating a curvilinear relationship.

## Reliability analysis

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

Industrial Design Where innovation starts 1946ZED09

## Types of reliability analysis

- **Scale reliability**
  - Internal consistency based on correlation
- **Split-half reliability**
  - Correlation between similar forms
- **Test retest reliability**
  - Correlation between test en second test
- **Inter-Rater reliability**
  - Correlation between multiple raters

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

/ Industrial Design 14-8-2009 PAGE 55

## Scale reliability: Practical usage

- When you know which construct you are measuring
- When you are only measuring 1 construct
- When dependent variable is of interval or ratio level
- When sample size is sufficient
  - $N = 50+5m$  ( $m$  = number of items)
  - $N > 300$
- **CAUTION:** Cronbachs Alpha is very dependent on the number of items: Ask the same question 20 times and you are bound to get high values.

## Scale reliability

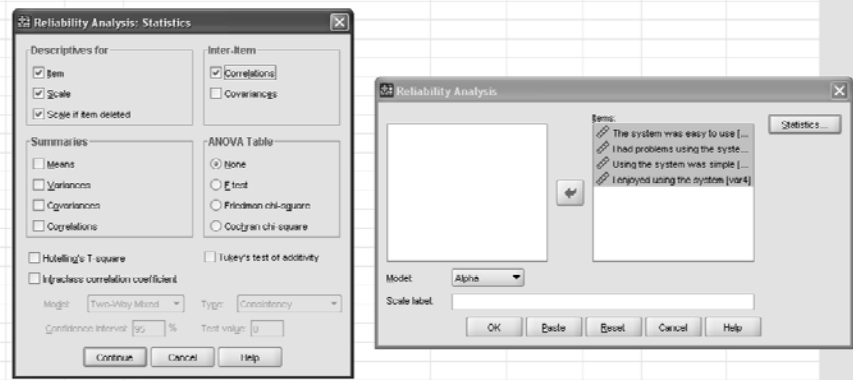

The screenshot shows the SPSS Statistics Data Editor interface. The main window displays a dataset with the following variables:

	Name	Type	Width	Decimals	Label	Values	Missing	Columns	Align	Measure
1	var1	Numeric	0	2	The system was easy to use	None	None	0	Right	Scale
2	var2	Numeric	0	2	I had problems using the system	None	None	0	Right	Scale
3	var3	Numeric	8	2	Using the system was simple	None	None	8	Right	Scale
4	var4	Numeric	8	2	I enjoyed using the system	None	None	8	Right	Scale

The 'Scale' menu option is highlighted in the 'Analyze' menu, with the following sub-options visible:

- Reliability Analysis...
- Multidimensional Unfolding (MUSCAL)...
- Multidimensional Scaling (MUSCAL)...
- Multidimensional Scaling (ALSCAL)...

## Scale reliability

## Scale reliability correlation matrix

**Inter-Item Correlation Matrix**

	Var 1	Var 2	Var 3	Var 3
Var 1	1,000	-,565	,631	,670
Var 2	-,565	1,000	-,807	-,678
Var 3	,631	-,807	1,000	,662
Var 3	,670	-,678	,662	1,000

## Scale reliability SPSS output

### Reliability Statistics

Cronbach's Alpha <sup>a</sup>	Cronbach's Alpha Based on Standardized Items <sup>a</sup>	N of Items
-.071	-.061	4

a. The value is negative due to a negative average covariance among items. This violates reliability model assumptions. You may want to check item codings.

### Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Squared Multiple Correlation	Cronbach's Alpha if Item Deleted
Var 1	12,1667	4,144	,641	,512	-1,747 <sup>a</sup>
Var 2	13,1000	20,093	-,786	,689	,847
Var 3	12,7000	4,769	,329	,701	-1,036 <sup>a</sup>
Var 3	13,2333	4,668	,551	,585	-1,410 <sup>a</sup>

a. The value is negative due to a negative average covariance among items. This violates reliability model assumptions. You may want to check item codings.

## How to mirror items

**For N point scale**

$$X_{i\_mirrored} = (N+1) - X_i$$

## After mirroring

**Inter-Item Correlation Matrix**

	Var 1	Var 3	Var 4	Var 2 Mirror
Var 1	1,000	,631	,670	,565
Var 3	,631	1,000	,662	,807
Var 4	,670	,662	1,000	,678
Var 2 Mirror	,565	,807	,678	1,000

## New scale reliability output

**Reliability Statistics**

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
,889	,890	4

**Item-Total Statistics**

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Squared Multiple Correlation	Cronbach's Alpha if Item Deleted
Var 1	12,2333	21,771	,689	,512	,882
Var 3	12,7667	18,323	,806	,701	,840
Var 4	13,3000	21,183	,757	,585	,859
Var 2 Mirror	13,1000	20,093	,786	,689	,847

## Split half reliability

- **Internal consistency reliability**
  - **Correlation between two sets of items measuring the same hypothetical construct**
- **High correlation means high internal consistency**

/ Industrial Design

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

14-8-2009 PAGE 64

## Test-retest reliability

- **Test stability over time**
  - **If I measure your EQ now, it should not be totally different next week**
- **Correlation between test scores administered in multiple points over time**

/ Industrial Design

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

14-8-2009 PAGE 65

## Inter-Rater reliability

- **Consistency (homogeneity) between raters**
  - **Observation studies**
- **Number of similar ratings**
- **High correlation means reliable scoring system.**

/ Industrial Design

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

14-8-2009 PAGE 66

## Factor analysis

If we want to do just a little bit more..

**TU/e** Technische Universiteit  
Eindhoven  
University of Technology

Industrial Design

Where innovation starts

PAGE 69

## What is factor analysis

- **Method of “restructuring” a large number of items into a more feasible small set of factors.**
- **For Data Reduction: Principal Component Analysis**
- **For Structure Detection: Principal Axis Factoring**
- **Two questions:**
  - **How many components (factors) are needed to represent the variables?**
  - **What do these components represent?"**

## Confirmatory versus Exploratory

- **Confirmatory factor analysis:**
  - **Confirms the hypothesized structure of the items**
  - **Used when underlying variables and constructs are well defined.**
- **Exploratory factor analysis:**
  - **Explore possible relations and factor structures**
  - **Used in early development for less well defined variables and constructs.**

## Steps to performing factor analysis

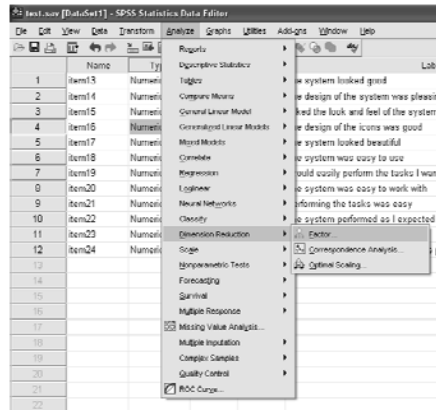

- **Determine items**
  - Use your generated item set
- **Get sufficient N**
  - Minimum 100
  - Minimum 300
  - $50 + 5*m$
- **Determine number of factors**
  - Scree plot, Eigenvalues, Explained variance
- **Rotate the factor solution for a simpler structure**
  - Varimax, Oblimin
- **Compute factor scores**
  - Regression

## Example: Our items

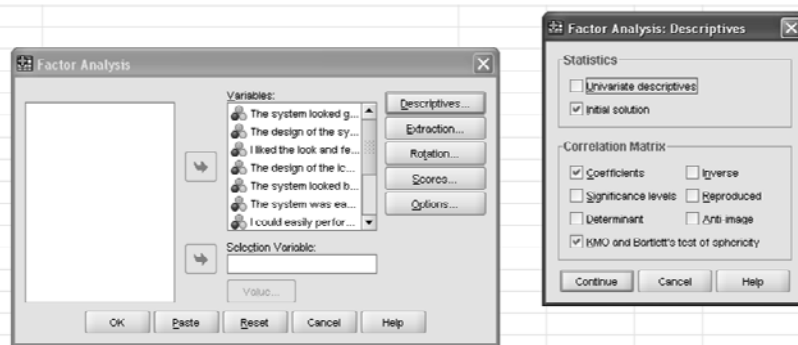

1. The system looked good
2. The design of the system was pleasing
3. I liked the look and feel of the system
4. The design of the icons was good
5. The system looked beautiful
6. The system was easy to use
7. I could easily perform the tasks I wanted to perform
8. The system was easy to work with
9. Performing the tasks was easy
10. The system performed as I expected
11. The icons were easy to understand
12. The interaction with the system was pleasant

All on a 5-point scale (Totally disagree, totally agree)  
(N=1428)

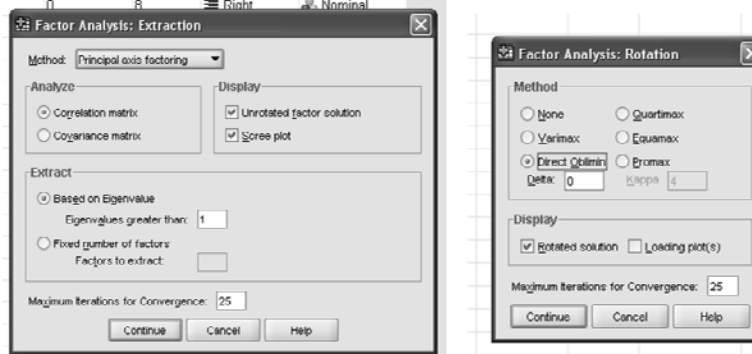

# Principal axis factoring SPSS

# PAF SPSS 2

## PAF SPSS 3

## KMO and Bartlett's test

**KMO and Bartlett's Test**

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		,935
Bartlett's Test of Sphericity	Approx. Chi-Square	8890,014
	df	66
	Sig.	,000

- **KMO**
  - Index magnitude of observed correlations versus partial correlations
  - > 0.8
- **Barlett's**
  - Test of correlation of the variables
  - Should be significant: Sig. < 0.05

# Communalities

Communalities		
	Initial	Extraction
The system looked good	,566	,665
The design of the system was pleasing	,566	,626
I liked the look and feel of the system	,555	,600
The design of the icons was good	,433	,444
The system looked beautiful	,582	,619
The system was easy to use	,570	,663
I could easily perform the tasks I wanted to perform	,460	,544
The system was easy to work with	,330	,366
Performing the tasks was easy	,511	,550
The system performed as I expected	,400	,452
The icons were easy to understand	,661	,644
The interaction with the system was pleasant	,528	,466

Extraction Method: Principal Axis Factoring.

- **Communality**
  - Measures the percent of variance in a given variable explained by all the factors jointly.
  - **Example:**
    - Factor solution explains the system "looking good" very well, but poorly explains the "performed as expected" item

# Total variance explained

Total Variance Explained							
Factor	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings <sup>a</sup>
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	
1	6.271	52,260	52,260	5,839	48,655	48,655	5,126
2	1,234	10,283	62,543	,800	6,669	55,324	4,813
3	,711	5,926	68,469				
4	,608	5,066	73,535				
5	,564	4,697	78,232				
6	,499	4,155	82,387				
7	,470	3,914	86,301				
8	,384	3,196	89,497				
9	,369	3,074	92,571				
10	,329	2,745	95,316				
11	,309	2,574	97,890				
12	,253	2,110	100,000				

Extraction Method: Principal Axis Factoring.

a. When factors are correlated, sums of squared loadings cannot be added to obtain a total variance.

- Variance in the items explained by the factors
- Cumulative > 60%
- If Eigenvalue < 1 – Factor explains less variance than individual item

## Scree plot

TU/e Technische Universiteit Eindhoven University of Technology

## Factor matrix

Factor Matrix<sup>a</sup>

	Factor	
	1	2
The system looked good	.718	-.388
The design of the system was pleasing	.714	-.341
I liked the look and feel of the system	.734	
The design of the icons was good	.639	
The system looked beautiful	.784	
The system was easy to use	.737	.347
I could easily perform the tasks I wanted to perform	.613	.410
The system was easy to work with	.555	
Performing the tasks was easy	.731	
The system performed as I expected	.619	
The icons were easy to understand	.802	
The interaction with the system was pleasant	.682	

Extraction Method: Principal Axis Factoring.  
a. 2 factors extracted. 6 iterations required.

- **Correlations between items and factors**
  - **Factor loadings**
  - **Suppressed values below 0.3**
  - **Factor 1 correlates highly with all items**
  - **Solution not simple to interpret.**
  - **High correlation means highly representative for the factor**

TU/e Technische Universiteit Eindhoven University of Technology

## Rotation

- To create a simpler to interpret factor solutions one can “rotate” the original factor solution.
  - Changes factor loadings
  - Eigenvalues / explained variance remains the same
- **Varimax**
  - **Ortogonal rotation**
  - **No correlations between factors**
- **Oblimin**
  - **Factors can be correlated**
  - **Realistic**

## Oblimin rotation

Pattern Matrix<sup>a</sup>

	Factor	
	1	2
The system looked good	.889	
The design of the system was pleasing	.831	
I liked the look and feel of the system	.731	
The design of the icons was good	.607	
The system looked beautiful	.555	.302
The system was easy to use		.794
I could easily perform the tasks I wanted to perform		.810
The system was easy to work with		.572
Performing the tasks was easy		.518
The system performed as I expected		.632
The icons were easy to understand	.509	.370
The interaction with the system was pleasant	.397	.352

Extraction Method: Principal Axis Factoring.  
Rotation Method: Oblimin with Kaiser Normalization.

a. Rotation converged in 10 iterations.

- **Factor loadings after rotating**
  - **Factor one: design of the system**
  - **Factor two: Ease of use**
- **Use highest correlations to name the factors**
- **Correlation factors: 0.6**
